

VS

Python vs Ruby

ARRAY SHUFFLE PROBLEM

CSE 451: Concepts of Programming
Languages

The Problem

➔Input

Given a string **s** and an integer array **indices** of the same length.

```
s = "art"  
indices = [1, 0, 2]
```

↻Output

Shuffle string so character at position **i** moves to **indices[i]**.

```
"rat"
```

'a' (idx 0) → idx 1

'r' (idx 1) → idx 0

't' (idx 2) → idx 2

Algorithm Step-by-Step

- **Initialize:** Create an empty result array of size N .
- **Iterate:** Loop through the input string with index i .
- **Place:** Assign $\text{result}[\text{indices}[i]] = s[i]$.
- **Join:** Convert the result array back into a string.

Complexity: $O(N)$ Time | $O(N)$ Space

Python

The "Batteries Included" Language

- **Created:** 1991 by Guido van Rossum.
- **Philosophy:** "There should be one-- and preferably only one --obvious way to do it."
- **Key Traits:** Dynamic typing, huge ecosystem (pip), explicit syntax.
- **Uses:** AI/ML, Data Science, Web (Django), Scripting.

Python Implementation

Key Features

- ▶ `enumerate(s)` gives us both index and character.
- ▶ List initialization: `[""] * len(s)` is idiomatic.
- ▶ `".join()"` is the standard way to build strings.

```
def shuffle_string(s, indices):  
    # Create empty list of size N  
    result = [''] * len(s)  
  
    for i, char in enumerate(s):  
        # Map current char to target index  
        result[indices[i]] = char  
  
    return ''.join(result)
```

Ruby

"Developer Happiness"

- ▶ **Created:** 1995 by Yukihiro "Matz" Matsumoto.
- ▶ **Philosophy:** "Optimize for programmer happiness."
- ▶ **Key Traits:** Pure OOP (everything is an object), flexible syntax (TIMTOWTDI), blocks.
- ▶ **Uses:** Web Dev (Ruby on Rails), DevOps (Puppet/Chef).

| Ruby Implementation

Key Features

- `Array.new` creates the structure.
- `each_char.with_index` chains enumerators elegantly.
- **Block Syntax:** `do |char, i| ... end` is central to Ruby.
- Implicit return (last line returns).

```
def shuffle_string(s, indices)
  # Initialize array with defaults
  result = Array.new(s.length, '')

  # Iterate with index
  s.each_char.with_index do |char, i|
    result[indices[i]] = char
  end

  # Implicit return
  result.join
end
```

Feature Comparison

Feature	Python 	Ruby 
Type System	Dynamic, Strong	Dynamic, Duck Typing
Array Init	<code>[""] * len(s)</code>	<code>Array.new(n, "")</code>
Iteration	<code>enumerate(s)</code>	<code>s.each_char.with_index</code>
Block Syntax	Indentation (whitespace)	<code>do/end</code> or <code>{ }</code>
String Join	<code>".join(list)</code>	<code>array.join</code>

| Challenges & Learnings

Environment Setup

Installing Ruby on Windows required the RubyInstaller and DevKit configuration to manage native extensions.

Syntax Curve

Adapting to Ruby's block syntax and method chaining (e.g., `.with_index`) was a shift from Python's direct style.

Verification

Ensuring both implementations produced identical output for edge cases (empty strings, single characters).

Live Demo

String Shuffle Algorithm

CSE 451: Concepts of Programming Languages

MODE: MANUAL (s + indices) AUTO (shuffle word)

s =

indices =

Run

Reset

Speed:

Presets: art--rat codeleet

Problem: Character at position i moves to indices[i]

Algorithm: `result[indices[i]] = s[i]`

Select a mode and enter values to start

INPUT STRING (s)

PYTHON RESULT

RUBY RESULT

Execution Log:

Python execution:

Execution Log:

Ruby execution:

```
def shuffle_string(s, indices):
    result = [''] * len(s)
    for i, char in enumerate(s):
        result[indices[i]] = char
    return ''.join(result)
```

```
def shuffle_string(s, indices)
    result = Array.new(s.length, '')
    s.each_char.with_index do |char, i|
        result[indices[i]] = char
    end
    result.join
end
```

Key Takeaway

"Understanding the **concepts** (arrays, indices, complexity)
matters more than the **syntax**."

Questions?

Thank you for listening.
